

ABSTRACT

A method and system for visually displaying bottleneck and real-time enterprise management information. An application integration platform receives plural types of data from manufacturing and information systems within an enterprise and analyzes the plural types of data to determine key performance indicators. A process control server receives manufacturing data derived from barcodes and sensors associated with manufacturing machines from at least one work center and forwards the manufacturing data to the application integration platform. A user interface that interfaces with the application integration platform provides a visual display of the key performance indicators and bottlenecks.
